

Hearing care at your convenience with ReSound Assist

It can be challenging for people who are new to amplification to get used to wearing hearing aids. The more obstacles we can eliminate on the path to becoming a regular hearing aid wearer, the better the chances that a person will become a successful user. One obstacle is simply getting the sound right, and ReSound Assist provides a tool that can facilitate this process. In a survey conducted by ReSound, 94% of hearing care professionals familiar with ReSound Assist agreed that it enables them to provide the best fit within a shorter period*. The role of ReSound Assist in easing the adaptation process is illustrated by Elaine's story.

Elaine has a busy lifestyle running a large family farm with her husband and their three adult children. She is 62 years old and has had impaired hearing since being diagnosed with otosclerosis at the age of 38. Although surgery improved her hearing initially, today she has a mixed, moderately severe loss. She tried wearing in-the-ear hearing aids about 10 years ago but they ended up staying in the drawer. Elaine recalls that she had returned to her hearing care professional multiple times to address issues with whistling, poor sound quality and wind noise when outdoors. She even had the hearing aids remade but ultimately she gave up on them. Complaints from her family about her hearing and an incident with a goat "sneaking up on her" from behind motivated her to try again. Her HCP fit her with ReSound LiNX 3D™ Mic-in-Helix (MIH) wireless hearing aids. Due to the style, Elaine was delighted that she had no issues with feedback or wind noise. However, like many new users, she did find it difficult to adjust to the many new sounds she was hearing.

Elaine's hearing care professional instructed her in using the ReSound Smart 3D app to adjust the sound

to her liking and activated ReSound Assist. During the first month with her new hearing aids, Elaine sent three requests via ReSound Assist. Two of them resulted in Elaine's hearing care professional sending her fine-tuned settings with adjustments to the frequency response, which Elaine was easily able to save to her hearing aids. After she had made the second request and uploaded the changes to her hearing aids, she quickly realized that she had liked the previous settings best. In a panic, Elaine sent a third request asking her hearing care professional to "undo" the changes. Rather than sending her yet another fine-tuning package, her hearing care professional sent her a response explaining that she could simply restore the previous settings herself in the app. At her follow-up appointment, Elaine expressed a high level of satisfaction with having access to highly personalized changes and advice without extra appointments. This was extremely important to Elaine's success since and one of the reasons her previous hearing aid trial was unsuccessful.

Elaine's use of ReSound Assist was beneficial to her in several important ways:

- Elaine had greater access to her hearing care professional without having to make extra visits. She felt that more support was available to her than she had experienced with her previous trial of hearing aids.
- Being able to quickly try out new settings without having to wait for a scheduled appointment helped Elaine adjust to and learn more quickly about her new hearing aids.
- ReSound Assist provided a convenient means for Elaine to learn about a feature she had available in the app that she had forgotten about from the instruction she received at the fitting.
